

Provide a screenshot of invoking the figlet function.

```
sourabhdeshmukh master ~ > Documents > github > faasd echo "Welcome to Openfaas CLI" | faas-cli invoke figlet
Welcome to
Openfaas CLI
sourabhdeshmukh master ~ > Documents > github > faasd
```

Provide a screenshot of running the following command.

```
sourabhdeshmukh$ sudo journalctl -u faasd --lines 40
```

```
sourabhdeshmukh master ~ > Documents > github > faasd sudo journalctl -u faasd --lines 40

Provide a screenshot of your OpenFaaS gateway AFTER deploying figlet, slack-handler and slack-interactive functions

The screenshot shows the OpenFaaS Portal interface. On the left sidebar, the 'slack-interactive' function is selected. The main panel displays the function's status as 'Ready' with 1 replica and 3 invocation counts. Below this, the 'Invoke function' section shows a successful invocation with a 200 status and a response body containing a Slack attachment object.

Status	Replicas	Invocation count
Ready	1	3

Image: docker.io/sourabhdeshmukh/slack-interactive:latest
 URL: http://localhost:8080/function/slack-interactive
 Function process: python index.py

Invoke function

☐ Text ☒ JSON ☐ Download

Request body: {"testing": "slack-interactive"}

Response status: 200
 Round trip (s): 0.117

Response body:

Provide a screenshot of invoking slack-request and slack-interactive functions

Slack request

The screenshot shows the OpenFaaS web interface at localhost:8080/ui/. On the left sidebar, the 'slack-request' function is selected. The main panel displays the function's details: Status is 'Ready', Replicas is 1, and Invocation count is 1. The Image is 'docker.io/sourabhdeshmukh/slack-request:latest' and the Function process is 'python index.py'. The URL is 'http://localhost:8080/function/slack-request'. Below this, the 'Invoke function' section shows the 'Text' radio button selected with a request body of 'testing slack-request function'. The response status is 200, the round-trip time is 0.105s, and the response body is a JSON object:

```
{  "text": "Serverless Message",  "attachments": [    {      "fields": [        {          "short": true,          "value": "100",          "title": "Amazing Level"        }      ]    }  ]}
```

Slack-interactive

The screenshot shows the OpenFaaS web interface at localhost:8080/ui/. On the left sidebar, the 'slack-interactive' function is selected. The main panel displays the function's details: Status is 'Ready', Replicas is 1, and Invocation count is 3. The Image is 'docker.io/sourabhdeshmukh/slack-interactive:latest' and the Function process is 'python index.py'. The URL is 'http://localhost:8080/function/slack-interactive'. Below this, the 'Invoke function' section shows the 'JSON' radio button selected with a request body of

```
{ "testing": "slack-interactive" }
```

. The response status is 200, the round-trip time is 0.117s, and the response body is a JSON object:

```
{  "attachments": [    {      "footer": "Slack Apps built on OpenFaaS",      "author_link": "https://github.com/sourabhdeshmukh/Cloud-CSEN-241",      "color": "#36a64f",      "text": "Head over to COEN 241",      "title": "COEN 241",      "ts": 123456789,      "author_name": "Sourabh Deshmukh",      "title_link": "https://www.scu.edu/engineering/academic-programs/department-of-computer-engineering/graduate/course-descriptions/"    }  ]}
```

- Complete the chatbot with a yml file

```
import requests
import datetime
import random

# Chatbot Handler Function
def handle(req):
    processedText = req.lower().strip()
    preformat = list(processedText.split())

    if "name" in preformat:
        response = get_name()
    elif "time" in preformat:
        response = get_time()
    elif "figlet" in preformat:
        response = get_figlet(req)
    else:
        return "here is a sample questions you can ask.\n\n1. What is your name\n2. what is the current time\n3. figlet generate HI\n"
    return response

# Random name generator for chatbot
def get_name():
    names = ["Assistant", "Alexa", "Siri"]
    return "Hi, I am " + random.choice(names)

- Invoking figlet function

- What is the command to invoke the slack-request function (2 pts)?
 - Via Curl

```
sourabhdeshmukh$ curl -X GET http://127.0.0.1:8080/function/slack-request -d "testing slack-request"
```

- Via faas-cli

```
sourabhdeshmukh$ echo "invoke slack-request" | faas-cli invoke slack-request
```

```
Terminal
sourabhdeshmukh / main > Assignments > HW2 > functions > echo "Invoke slack-request" | faas-cli invoke slack-request

}
```

- How would you pass different arguments to the functions?
 - There are two types of arguments we can pass to the function
 - Text
 - Json
 - We can pass the arguments while invoking the openfaas function
 - We can invoke the function on the web UI of the openfaas.

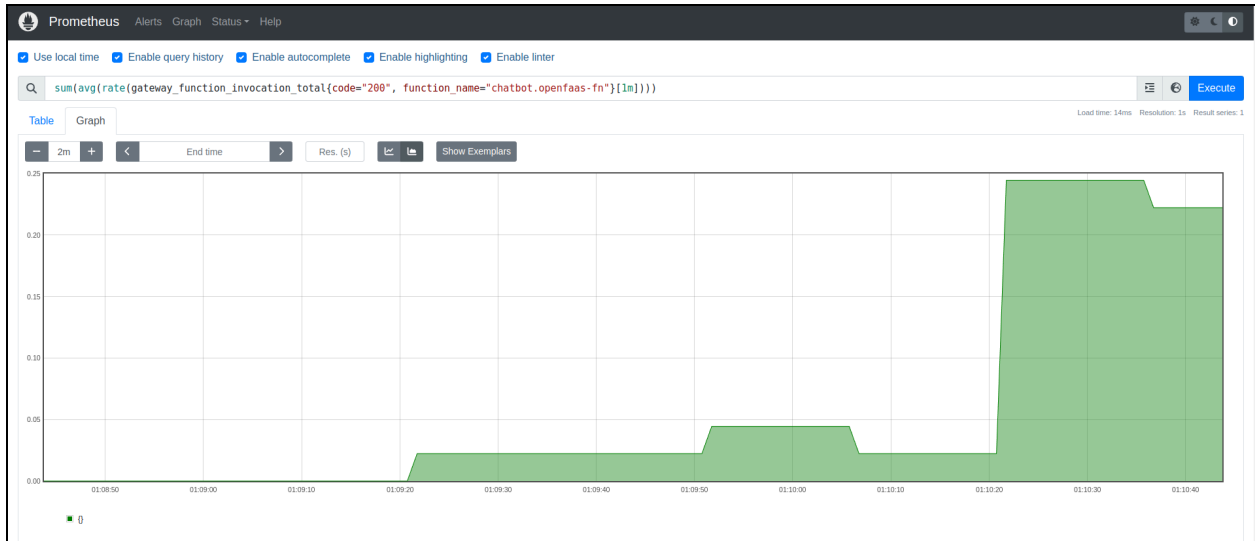

- We can invoke the function using the curl command and using the -d option we can provide the json or text argument.
 - Another way is by using the faas-cli. We can invoke the function using echo "arguments" | faas-cli invoke <function-name>.
 - We can provide the content type inside the yaml file either we can provide the application/json or text/plain content type.
 - We can also alter the arguments to the function and depending upon the request we can perform the changes inside the handler function to process the text based or the json based request.
- How would you change the slack-interactive function to react to different inputs?
 - In order to provide the additional support to function to react to different inputs we can leverage the response object, which serves as a Python dictionary containing the user's input. The function already processes the request as JSON and stores it within the response object, so direct access to the user input becomes feasible.
 - The important steps that needs to be performed in the function are:
 1. Accepting the request in either text or JSON format within the handler.py file.
 2. Utilizing the unquote function from the urllib package to decode the request string, typically employing UTF-8 encoding.
 3. Making use of the json.load() method to convert the valid JSON request into a Python dictionary, which is then stored in the response object.
 4. At present the response object remains unused within the function.
 5. To activate the function to respond to varied inputs, extracting the user input data from the response object becomes very important, given its structure as a Python dictionary. While returning json.dumps(data), the function becomes capable of reacting to different inputs based on the data present in the response object.
 - How long does it take for the chat response to come back?
 - For the first request that does not call figlet
0.2657 sec

- For the second request that does not call figlet
0.0069 sec

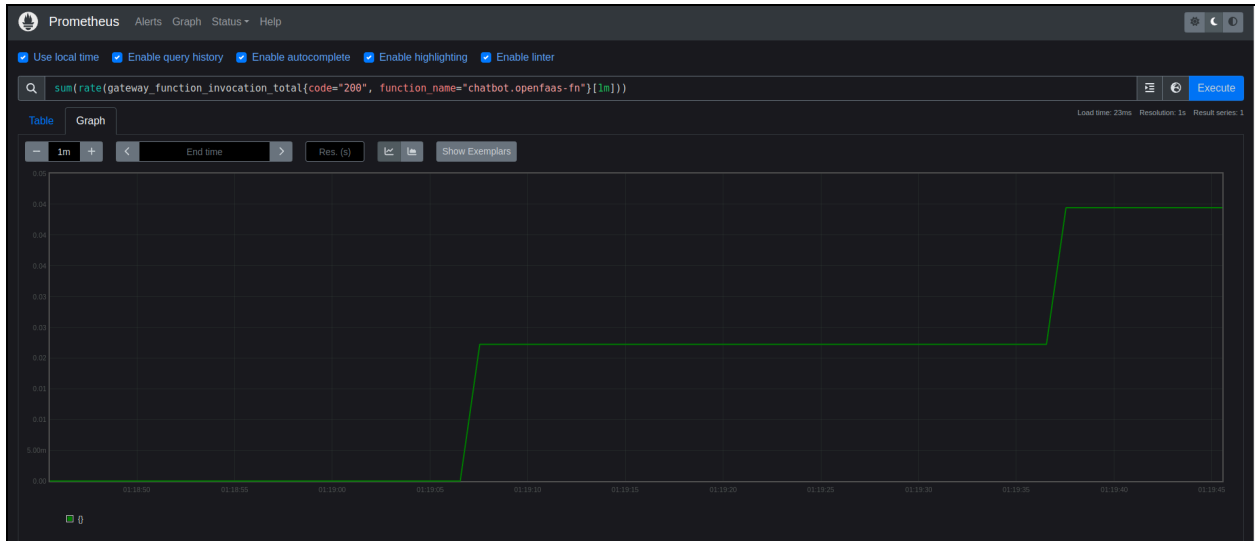

- Average over 10 requests that do not call figlet
0.6732 sec

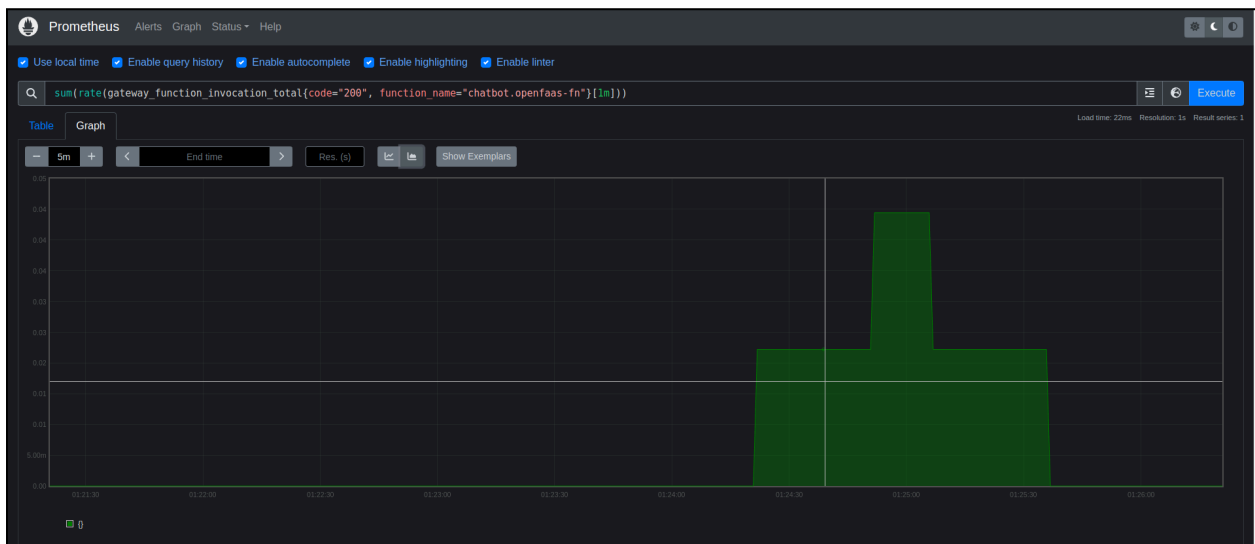

- For the first request that calls figlet
1.0195 sec

- For the second request that calls figlet
0.8624 sec

- For the second request that calls figlet that follows the first request that does not call figlet
0.8988 sec

- Average over 10 requests that do call figlet
0.8074 sec

Overall metrics result for above questions.

```

sourabhdeshmukh$ python metrics.py
Response time for the first request using no figlet call: 0.2657 seconds
Response time for the second request using no figlet call: 0.0069 seconds
Average response time over 10 requests using no figlet call: 0.6732 seconds
Response time for the first request using with figlet call: 1.0195 seconds
Response time for the second request using with figlet call: 0.8624 seconds
Response time for the second request using with figlet and after without figlet call: 0.8988 seconds
Average response time over 10 requests using figlet call: 0.8074 seconds
sourabhdeshmukh$

```

- Now try sending a series of requests to the chatbot in parallel. At what queries per second does OpenFaaS add a new instance of the function?

I have used the hey load testing tool to send requests to my function. Below is the command I used to send 10 requests per second for 60 seconds, with a payload of data=time to the /function/chatbot endpoint on localhost port 8080:

```
sourabhdeshmukh$ hey -z 60s -q 20 -c 10 -m POST -d=time'
http://127.0.0.1:8080/function/chatbot
```

The alert expression in Prometheus Alertmanager is configured to trigger an alert when the function invocation count is greater than 1 over a 5 second period. During my test, the invocation count exceeded 1, which triggered the alert to fire and caused OpenFaaS to scale the function by adding another instance. At that point, the queries per second (QPS) was around 1.5425 as the new instance was launching.

Please find below screenshots obtained during testing
